1.0 INTRODUCTION

This closeout report summarizes the characterization and accelerated action activities conducted at Individual Hazardous Substance Site (IHSS) Group 800-4 at the Rocky Flats Environmental Technology Site (RFETS or Site) in Golden Colorado. IHSS Group 800-4 consists of one Under Building Contamination (UBC) site and two IHSSs

- UBC 886, Critical Mass Laboratory,
- IHSS 164 2, Radioactive Site #2, 800 Area, Building 886 Spill, and
- IHSS 000-121, Building 828 Sump, Tanks (21, 22, and 27) and Original Process Waste Lines (OPWL) (partial IHSS only)

The location of IHSS Group 800-4 is shown on Figure 1, and the UBC site and IHSSs are shown on Figure 2

Characterization and accelerated action activities were planned and executed in accordance with the Industrial Area (IA) Sampling and Analysis Plan (SAP) (DOE 2001a), IASAP Addendum #IA-02-03 (DOE 2001b), and the Environmental Restoration (ER) Rocky Flats Cleanup Agreement (RFCA) Standard Operating Protocol (RSOP) for Routine Soil Remediation (ER RSOP) (DOE 2002a). Notification of the planned activities was provided in ER RSOP Notification #02-03 (DOE 2002b), which was approved by the Colorado Department of Public Health and Environment (CDPHE) on March 26, 2002 (CDPHE 2002)

This report contains the information necessary to demonstrate attainment of cleanup objectives and final closure of IHSS Group 800-4, including

- Site Characterization Information
 - Description of historical information for the UBC and IHSSs, including pre-accelerated action activities
 - Description of site characterization activities
 - Site characterization data, including data tables and maps
- Site Accelerated Action Information
 - Description of the accelerated action, including the rationale for the action and map of the target remediation area (if applicable)
 - Map of the actual remediation area, including bounds of the excavation, and dates and durations of specific remedial activities (if applicable)
 - Photographs documenting site characterization and accelerated action activities
- Confirmation sampling data, including data table and sampling location map, as well as a comparison of the confirmation data and applicable cleanup goals (if applicable)

- Description of any deviations from the ER RSOP (if applicable)
- Description of near-term stewardship actions and long-term stewardship recommendations
- Description of wastes generated
- Description of site condition upon completion of accelerated action activities, including a map of residual contamination above background mean plus two standard deviations (background), method detection limits (MDLs), and/or Tier II action levels (ALs), if any
- Description of site reclamation activities
- Table of No Longer Representative (NLR) locations that have been remediated (if applicable)
- Data quality assessment (DQA), including comparison of confirmation data with project data quality objectives (DQOs)

2.0 SITE CHARACTERIZATION

Characterization information for IHSS Group 800-4 includes historical knowledge and analytical data. Historical information for the UBC and IHSSs is presented below in Sections 2.1 through 2.3. Analytical data are presented in Section 2.4.

2.1 UBC 886, Critical Mass Laboratory

Information on Building 886, Critical Mass Laboratory, is from the Historic American Engineering Record (HAER) (DOE 1998). Building 886 was commissioned in 1965 to house the Nuclear Safety Group, which performed criticality experiments on a variety of fissile materials to establish criticality limits and ensure safe handling and processing during Site operations.

Approximately 1,700 critical mass experiments were conducted in Building 886 between 1965 and 1987. Highly enriched uranium (HEUN) was introduced into the building in the summer of 1965, and the first experiments were performed in September 1965. Subsequently, the building was used to perform experiments on enriched uranium metal and solutions, plutonium metal, and low-enriched uranium oxide. After 1983, experiments were conducted primarily with uranyl nitrate solutions.

Typical critical mass experiments conducted in Building 886 involved removing the fissile material from storage, placing it in one of the reactivity addition devices, operating the device remotely until criticality was achieved, measuring the slightly supercritical parameters, reversing the operation of the device to slightly subcritical, and returning the fissile material to storage. The experiments were conducted in a controlled manner and generally involved power levels of no more than 10 milliwatts for no more than one hour. Approximately one-half of the experiments conducted in Building 886 actually achieved criticality.

Other experiments were performed to validate safety parameters for the storage of fissionable solutions in raschig ring tanks, resulting in the design of two substitute storage tank configurations the annular tank and point tube tank. These designs allowed for more economical solution testing with no decrease in safety. Experiments were also conducted to validate the cross-sections and usefulness of materials used at the Site.

The work performed in Building 886 supported the Site's nuclear weapons production activities and assisted the U S Nuclear Regulatory Commission in setting industry safety standards. The measurements were essential to validate computer models that were, in turn, used to establish nuclear criticality safety operating limits at U S Department of Energy (DOE) facilities.

Building 886 was decommissioned in accordance with the Interim Measure/Interim Remedial Action (IM/IRA) Action Plan for the Building 886 Cluster (RMRS 1998).

2.2 IHSS 164.2, Radioactive Site #2, 800 Area, Building 886 Spill

The area immediately surrounding the building has been a source of concern for possible soil contamination. The summary of events provided in the HAER indicates a contamination release on June 9, 1969, however, no details are given in that report. In addition, on September 26, 1989, a 500-gallon stainless steel portable tank was found leaking a colorless liquid from its drain valve onto the concrete, creating a wet spot approximately five inches in diameter. A radiation monitoring survey of the area resulted in direct counts of 650 counts per minute (cpm), and 12 to 24 disintegrations per minute (dpm) on a smear. This was considered low-level contamination. At that time, the valves were tightened, decontaminated and bagged, and the tank was shipped to the size reduction facility in Building 776. The concrete was decontaminated and sealed with acrylic paint. Soil samples indicated contamination from uranium.

2.3 IHSS 000-121, Building 828 Process Waste Pit - Sump, Tanks (21, 22, 27) and Original Process Waste Lines (OPWL)

Building 886 contains several OPWL components, including Building 828, a below-grade concrete vault containing a sump, process waste tanks, and associated process waste lines. Tank T-21 was a 250-gallon floor sump located in the southeast corner of the vault. Tank T-22 consisted of two, 250-gallon stainless steel tanks located on the floor of the vault. Tank T-27 was a 500-gallon portable tank that was located on a concrete pad north of Building 828. This tank was used to transfer process waste from Tanks T-21 and T-22 to the Site waste treatment facility.

Tanks T-21 and T-22 were installed in 1963 and abandoned in 1978. It is unknown when Tank T-27 was installed. Tank T-22 held waste from the laboratories in Building 886, including radionuclides, laboratory soaps, janitorial cleaning fluids, and possible nitrates. Tank T-21 captured overflow from T-22.

Historical reports indicate Tanks T-21, T-22, and T-27 may have been associated with cesium-137 handling. No known releases at this location were identified in these reports. High purity germanium (HPGe) surveys conducted during the Operable Unit (OU) 9 Phase I Remedial Investigation/Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI/RI) (DOE 1992) indicated radium-226, thorium-232, uranium-235, and uranium-238 were above background. Two sodium iodide surveys indicated radionuclide activity above background.

directly west of the tanks on the concrete driveway, and at the northeast corner of Building 828. Activities ranged from 1,000 to 2,200 cpm.

Tank T-27 was decontaminated, removed, and transported to the Building 776 size reduction facility in July 1989 after a state employee noted a wet area, approximately 4 to 5 inches in diameter, under the bottom drain valve of the tank. Tanks T-21 and T-22 were removed with Building 828 and the associated OPWL in accordance with the IM/IRA Action Plan for the Building 886 Cluster (RMRS 1998).

2.4 Analytical Data

As described in IASAP Addendum #IA-02-03 (DOE 2001b), potential contaminants of concern (PCOCs) at IHSS Group 800-4 were determined based on data collected during characterization of UBC 886, as summarized in the Final Data Summary Report for the Characterization of UBCs 123 and 886 (DOE 2001c), and data collected during previous studies (DOE 2000a, DOE 2001c). These pre-accelerated action data, greater than background or the MDLs, are shown on Figures 3 and 4.

Results of previous sampling and analysis of surface soil at IHSS Group 800-4 indicate that radionuclides and metals were detected at concentrations greater than background, and semivolatile organic compounds (SVOCs) were detected in surface soil at concentrations greater than MDLs. SVOCs and volatile organic compounds (VOCs) were detected in subsurface soil at concentrations greater than RFCA Tier II ALs.

The new characterization sampling locations proposed in IASAP Addendum #IA-02-03 (DOE 2001b) are shown on Figure 5. The actual characterization sampling locations are shown on Figure 6. The differences between the planned and actual sampling locations are summarized in Table 1.

Table 2 details the characterization sampling specifications. The characterization data are summarized by location in Table 3, and by analyte in Table 4. As shown on Figures 7a and 7b, background exceedances and/or detections of organics greater than the MDLs occur at several locations within the IHSS Group, however, all are below Tier I ALs. Sum of ratio (SOR) calculations were based on the following contaminants of concern (COCs):

- Radionuclides (americium-241, plutonium-239/240, uranium-235),
- Metals (aluminum, arsenic, barium, beryllium, cadmium, calcium, cobalt, copper, lead, lithium, mercury, strontium, thallium, and zinc),
- Inorganics (nitrate and nitrite), and
- Organics (VOCs and SVOCs)

Characterization sample SORs are listed in Table 5 and depicted in Figures 8a through 8d. The Area of Concern (AOC) is shown in Figure 9. Characterization sampling results indicate that all contaminant concentrations are less than RFCA Tier I ALs. Tier II SORs for nonradionuclides exceed the threshold value of 1 at 10 locations in surface soils and 15 locations in subsurface soils. The extent and magnitude of Tier II nonradionuclide exceedances are shown in Figures 8b and 8d. The compounds primarily contributing to the Tier II SOR exceedances are arsenic and

beryllium Individual compounds that exceed Tier II ALs include arsenic (at CI38-0022), beryllium (at CI38-0015), 1,2-dichloroethane (at CI38-0022), and methylene chloride (at CI38-0002) These exceedances occur only at three locations rather than the 15 locations based on the more conservative SOR approach The SOR calculations are conservative considering that arsenic and beryllium values are less than background at the majority of the sampling locations The complete dataset is provided on a compact disc in Appendix A

Because there are Tier II SOR exceedances in the characterization samples, these data are further evaluated by calculating the 95% upper confidence limit (UCL) of each COC across the AOC The SOR approach is then re-applied using the 95% UCL value to determine if remediation is necessary

SOR values and 95% UCL calculations are provided in Tables 6 and 7 for subsurface and surface soil, respectively As shown in Table 6, the SOR for subsurface soil across the AOC is greater than 1 However, none of the 95% UCL values exceeds the corresponding Tier II AL Further, the majority of the metal UCLs are less than background The SOR values were therefore re-calculated to include only those compounds with 95% UCL values greater than background The 95% UCL for all detected organic compounds was also retained in the SOR calculations Based on these parameters, the revised SOR value for subsurface soil is less than the threshold value of 1 Therefore, no further action is warranted for subsurface soil

Table 7 summarizes the 95% UCL and SOR calculations for surface soil The uncensored Tier II SOR exceeds 1 However, the primary drivers are arsenic and beryllium The arsenic and beryllium concentrations are likely contributing to false positives because the 95% UCL for both of these compounds is less than background Omitting arsenic, beryllium, and other metals with 95% UCL values that are less than background from the SOR calculations results in a recalculated SOR value of zero Similar to subsurface soil, no further action is required for surface soil

3.0 ACCELERATED ACTION

Accelerated action objectives were developed and described in ER RSOP Notification #02-03 (DOE 2002b). The accelerated action objectives for IHSS Group 800-4 included the following:

- Remove the Building 886 slab and dispose or disposition the concrete according to the RSOP for Recycling Concrete (DOE 1999),
- Remove contaminated soil (if any) associated with the Building 828 sump and tanks to below Tier I ALs,
- Remove contaminated subsurface soil (if any),
- Remove contaminated soil (if any) associated with OPWL to below RFCA Tier ALs, and
- Disrupt the foundation drain potential pathway

All removal activities were completed by the Remediation, Industrial Deactivation & Decommissioning (D&D) and Site Services (RISS) organization in accordance with the Interim Measure/Interim Remedial Action (IM/IRA) Plan for the 886 Cluster (RMRS 1998), the RSOP for Facility Component Removal, Size Reduction, and Decontamination Activities (DOE 2002c), and the RSOP for Facility Disposition (DOE 2000b). The ER Program's involvement in the project was limited to characterization sampling in accordance with IASAP Addendum #IA-02-03, as detailed in Section 2.4. Sampling activities were conducted beginning March 14, 2002, and concluding on June 13, 2002. No contamination above RFCA Tier I ALs was found and no further consultation with the regulatory agencies resulted in the need to remove surface or subsurface soils. Project photographs are provided in Appendix B.

D&D activities are documented in the Final Project Closeout Report for the 886 Cluster Closure Project (K-H, 2002). Facility stripout began in the late 1990s, during which time equipment was removed from Buildings 886 and 828, and the OPWL were drained and the ends grouted closed. Facility demolition was initiated on April 1, 2002, and completed on April 23, 2002. During this time, the Building 886 slab and Building 828 Pit were removed, as were OPWL P-63 and P-64. OPWL P-65 and P-66, which appeared on facility engineering drawings, were not found and there was no evidence that they had ever been installed (i.e., there were no penetrations into the north side of the Building 828 Pit) (see Figure 10). Gravel and soils from the excavated areas were temporarily stockpiled just north of the former Building 828 Pit. Samples were collected from the soil stockpile to determine the final disposition. Results are shown in Table 8. Because analytical results from the stockpile samples did not exceed RFCA Tier II subsurface soil ALs, this material was placed back into the excavations. In addition, the foundation drain was grouted to disrupt the potential pathway to groundwater, as was the sanitary sewer line. The following remaining features are shown on Figure 10:

- Portions of the ventilation tunnel that ran between Building 886 and Building 875 (walls and floor of tunnel >3 feet below grade),
- An electrical manhole (>3 feet below grade),
- The grouted foundation drain (>3 feet below grade), and

- The sanitary sewer line running west from the midpoint on the west side of Building 886, to approximately the midpoint between Building 886 and Building 865, then north to a manhole in the driveway leading to Building 865 where it was disconnected and grouted shut (approximately 6 feet deep)

4.0 ACCELERATED ACTION GOALS

ER RSOP Notification #02-03 (DOE 2002b) accelerated action project objectives were achieved through the following

- The Building 886 concrete slab and OPWL were removed by RISS D&D in accordance with the IM/IRA IRA Plan for the 886 Cluster (RMRS 1998), the RSOP for Facility Component Removal, Size Reduction, and Decontamination Activities (DOE 2002c), and the RSOP for Facility Disposition (DOE 2000b) Concrete was disposed or dispositioned in accordance with the RSOP for Recycling Concrete (DOE 1999)
- The foundation drain was disrupted by RISS D&D to eliminate the potential pathway to surface water
- No surface or subsurface soils were found to contain contaminant concentrations greater than RFCA Tier I ALs, therefore, no soils were removed from the area

Removal activities were consistent with and contributed to the ER RSOP overall long-term remedial action objectives (RAOs) for RFETS soil This contribution is described below

- RAO 1 Provide a remedy consistent with the RFETS goal of protection of human health and the environment Removal of the Building 886 slab and OPWL contributed to the protection of human health and the environment because potential sources of contamination have been removed
- RAO 2 Provide a remedy that minimizes the need for long-term maintenance and institutional or engineering controls Removal of the Building 886 slab and OPWL minimizes the need for long-term maintenance and institutional or engineering controls because potential sources of contamination have been removed
- RAO 3 Minimize the spread of contaminants during implementation of accelerated actions Best management practices were used to prevent the spread of contaminants during the accelerated action Air monitoring data during the accelerated action did not indicate any exceedances

5.0 STEWARDSHIP ANALYSIS

The IHSS Group 800-4 stewardship evaluation was conducted through ongoing consultation with the regulatory agencies The regulator agencies were informed through frequent project updates, e-mail, telephone contact, and personal contact throughout the project duration Copies of these documents are provided in Appendix C

5.1 Current Site Conditions

As discussed in Section 3.0, the accelerated action was limited to characterization sampling to fully characterize UBC 886, IHSS 164.2, and IHSS 000-121 in order to make an action/no further action determination. Residual contamination at characterization sampling locations and pre-accelerated action sampling locations is shown on Figures 11a and 11b.

The following conditions now exist for IHSS Group 800-4:

- Potential sources of contamination that had existed in IHSS Group 800-4 (i.e., the Building 886 slab and associated OPWLs) have been removed, or were found not to exist in the case of some OPWLs,
- A potential contaminant pathway that had existed in IHSS Group 800-4 (i.e., the Building 886 footing drain) has been disrupted,
- Surface soil contamination is present above background or MDLs (beryllium), and
- Subsurface contamination is present above background or MDLs (arsenic, 1,2-dichloroethane, and methylene chloride)

The site has been backfilled, regraded, covered with 6 inches of topsoil and seeded with Canada bluegrass using broadcast seeding methods.

5.2 Near-Term Management Recommendations

Because residual contaminant concentrations are low and potential contaminant sources were removed, mitigated or found not to have existed, no specific near-term management techniques are required. Potential contaminant sources and pathways have been removed. Contaminant concentrations in soil remaining at IHSS Group 800-4 do not trigger any further accelerated action. Near-term recommendations include the following:

- Excavation at the site will continue to be controlled through the Site Soil Disturbance Permit process,
- Fencing and signs restricting access will be posted to minimize disturbance to newly-revegetated areas, and
- Site access and security controls and the Soil Disturbance Permit process will remain in place pending implementation of long-term controls.

5.3 Long-Term Stewardship Recommendations

Based on remaining environmental conditions at IHSS Group 800-4, no specific long-term stewardship activities are recommended for IHSS Group 800-4 beyond the generally applicable Site requirements that may be imposed on this area in the future, which are dependent upon the final remedy selected. Institutional controls that will be used as appropriate for this area include the following:

- Prohibitions on construction of buildings in the IA,
- Restrictions on excavation or other soil disturbance, and
- Prohibitions on groundwater pumping in the area of IHSS Group 800-4

No specific engineered controls are recommended as a result of the conditions remaining in IHSS Group 800-4

No specific environmental monitoring is recommended as a result of the conditions remaining in IHSS Group 800-4

No specific institutional or physical controls, such as fences are recommended as a result of the conditions remaining in IHSS Group 800-4

This closeout report and associated documentation will be retained as part of the Rocky Flats administrative record file. These specific long-term stewardship recommendations will also be summarized in the Rocky Flats *Long Term Stewardship Strategy*.

IHSS Group 800-4 will be evaluated as part of the Sitewide Comprehensive Risk Assessment, which is part of the RCRA Facility Investigation/Remedial Investigation (RFI/RI) and Corrective Measures Study/Feasibility Study (CMS/FS) that will be conducted for the Site. The need for and extent of any, more general, long-term stewardship activities will also be analyzed in RFI/RI and CMS/FS and will be proposed as part of the preferred alternative in the Proposed Plan for the Site. Institutional controls and other long-term stewardship requirements for Rocky Flats will ultimately be contained in the Corrective Action Decision/Record of Decision, in any post-closure Colorado Hazardous Waste Act permit that may be required, and in any post-RFCA agreement.

6.0 POST-ACCELERATED ACTION CONDITIONS

Residual contamination concentrations greater than background or MDLs at IHSS Group 800-4 are shown on Figures 11a and 11b

7.0 WASTE MANAGEMENT

Waste generated as a result of the accelerated action was limited to the following

- Approximately 10 gallons of personal protective equipment and plastic from characterization sampling activities was considered low-level waste (LLW) by default. This waste was dispositioned with like materials in accordance with the ER Waste Management Plan (K-H 2001)
- Approximately 0.65 cubic yards of soil from excess sample material (i.e., sample returns) was placed into a 55-gallon drum (#DD0946), which is being used to accumulate excess sample material from various ER projects. When full, the drum will be sampled and dispositioned in accordance with the ER Waste Management Plan (K-H 2001)
- Groundwater from the Building 828 Pit was pumped into a tanker truck containing water from the Building 886 hydrolasing activity. The combined waters (approximately 630 gallons) were sampled and analyzed in accordance with the Site's Incidental Waters Program prior to transfer to the Building 891 for treatment. Two samples were analyzed for gross alpha and gross beta. One sample contained 45 pCi/l gross alpha and 88 pCi/l gross beta. The other sample 50 pCi/l gross alpha and 85 pCi/l gross beta.

Other wastes, including contaminated concrete, were dispositioned by RISS D&D, as documented in the Final Project Closeout Report for the 886 Cluster Closure Project (K-H 2002)

8.0 SITE RECLAMATION

All excavated areas were backfilled and revegetated after characterization sampling results were received and discussed with the regulatory agencies through the consultative process. Excavated soil was used as backfill in the trench that it was removed from. Additionally, backfill from offsite sources was used to bring excavated areas up to grade.

The IHSS Group 800-4 area was rough graded before 6 inches of topsoil were distributed over the site. The topsoil was graded, then scarified, and a seed mix consisting of Canada bluegrass was spread over the site using broadcast seeding methods. Hydromulch was applied to conserve moisture and prevent seed erosion.

9.0 NO LONGER REPRESENTATIVE SAMPLING LOCATIONS

Not applicable to this project, as no soils were remediated

10.0 DATA QUALITY ASSESSMENT

This DQA is based on various criteria derived from the following U S Environmental Protection Agency (EPA) Guidance and DOE quality requirements

- Guidance for the Data Quality Objective Process, EPA QA/G-4, 1994
- Guidance for the Data quality Assessment Process, Practical Methods for Data Analysis, EPA QA/G-9, 1998
- General Guidelines for Data Verification and Validation, DA-GR01-v1, December 3, 1997
- V&V Guidelines for Isotopic Determinations by Alpha Spectrometry, DA-RC01-v1, 2/13/98
- V&V Guidelines for Volatile Organics, DA-SS01-v1, 12/3/97
- V&V Guidelines for Semivolatile Organics, DA-SS02-v1, 12/3/97
- USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review, EPA 540/R-94/013
- USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review, EPA 540/R-94/012
- Evaluation of Radiochemical Data Usability, ES/ER/MS-5, Lockheed-Martin, 1997
- Rocky Flats Cleanup Agreement (RFCA), Attachment 5, March 21, 2000
- Industrial Area Sampling and Analysis Plan (IASAP), Rocky Flats Environmental Technology Site, June 2001

10.1 DQO Decisions

Consistent with the original DQO decision rules of the project, an SOR calculation was performed on sample results. If the summation for radiological and non-radiological constituents does not exceed 1, respectively, relative to RFCA Tier I ALs, then remediation is not required. If SORs exceed one relative to Tier II, then some management action is required, but not necessarily remediation. All SORs, calculated per sample, were below 1 relative to Tier I ALs, hence no remediation within IHSS Group 800-4 is required. Several samples, listed below (4 subsurface soil and 1 surface soil, respectively), exceeded unity for SORs relative to Tier II ALs, primarily due to either 1,2-dichloroethane, arsenic, or beryllium. SOR calculations are retained within the database "xx", peer review calculations and quality control (QC) evaluations were performed in the database "PlanvsActuals2.mdb"

<u>Sample Location</u>	<u>Field Sample Number</u>	<u>Primary Analyte Driving SOR</u>

Beryllium

10.2 Verification and Validation of Results

Verification ensures that data produced and used by the project are documented and traceable in accordance with quality requirements. Validation consists of a technical review of data that directly support the project decisions, such that any limitations of the data relative to project goals are stated. Verification and validation (V&V) criteria include

- Chain of custody,
- Preservation and hold-times,
- Instrument calibrations,
- Preparation blanks,
- Interference check samples (metals),
- Matrix spike/matrix spike duplicates (MS/MSD),
- Laboratory control samples (LCSs),
- Field duplicate measurements,
- Chemical yield (radiochemistry),
- Required quantitation limits/minimum detectable activities (sensitivity of chemical and radiochemical measurements, respectively), and,
- Sample analysis and preparation methods

These are addressed in the following paragraphs

10.2.1 Precision

Precision of field sampling was adequate based on 13 of 14 field duplicate samples repeating concentrations to quantities below all respective RFCA Tier II ALs. The one exception, Field Sample 02E0080-001 (Sample Location CI38-0046), exceeded the Tier II SOR threshold whereas its field duplicate did not. In this case the exceedance is treated as such and resampling was not performed.

Laboratory precision was within project goals (<30% relative percent difference [RPD]), based on MS/MSD comparisons. Exceptions were iron, aluminum, and silica, but none of these analytes exceeded Tier II ALs, thus results were repeatable to quantities below Tier II ALs and did not impact project decisions.

10.2.2 Accuracy and Bias

Distance measurements recorded on maps are within ± 1 ft, based on the global positioning system (GPS) technology in use (i.e., Trimble 4800 Series)

LCSs were collected at adequate frequencies (i.e., ≥ 1 /lab batch), and were within QC tolerances, with exceptions for the SVOCs and alpha spectroscopy results, where no LCS results are provided in the electronic data deliverable (EDD). For the given LCS results, all recoveries were $>84\%$. Analyte lists for spikes were short lists for EPA Method SW-846 8260. A complete list of spikes was used for SW-6010. The same comments apply to MS samples. MS recoveries were relatively low for cadmium and lead, 39% and 37% respectively, in batch 2091170, which presents the possibility for low bias in Field Sample 02E0020-002 (Sample Location CI38-H032) for cadmium and lead, otherwise, minimum recoveries were $>54\%$ other than for the exceptions noted.

Methylene chloride results in real samples should be evaluated as nondetects and should not be used in SOR calculations, as the real results do not exceed 10 times their associated laboratory blank concentrations. Consequently, Field Sample 02E0058-024 (Sample Location CI38-024) which exceeded unity relative to SORs for RFCA Tier II ALs, should not be considered contaminated.

10.2.3 Representativeness

Samples acquired for the project are representative based on the number and location of samples acquired, in combination with the following criteria:

- Familiarity with Site history and current IHSS configurations, and collaborations by management and technical staff,
- Implementation of industry-standard chain of custody protocols,
- Compliance with sample preservation and hold times, with the following exceptions noted by Field Sample Number and the corresponding Sample Location Number

<u>Field Sample Number</u>	<u>Sample Location Number</u>
02E0079-002	CI38-0031
02E0079-003	CI38-0023
02E0079-004	CI38-0023
02E0080-001	CI38-0046
02E0080-002	CI38-0047
02E0080-003	CI38-0048
02E0080-005	CI38-0046
02E0020-002	CI38-H032

Hold times were exceeded by several days for nitrite and nitrate samples, which could present the potential for low bias in the reported concentrations. Based on the relatively high ALs for

05

nitrites (i.e., 192,000 mg/kg), a low bias in the nitrite numbers, given the measured concentrations, is probably not significant

- Documented and Site-approved methods, particularly standard operating procedures controlled by the subcontractor, and
- Compliance with CDPHE- and EPA-approved sampling and analysis plans (i.e., the IASAP and associated Addenda)

10.2.4 Completeness

Sampling completeness is addressed in Table 9, where the planned samples are reflected in the upper portion of the table and actual samples with usable analytical/radiological results are reflected in the middle portion. Completeness percentages for each analytical grouping are given at the bottom of the table. The completeness goal of 90% was achieved for soil matrices with exceptions ranging downward to 88% completeness. Statistical confidence in results relative to action levels is not compromised by these slight disparities (i.e., 2%), thus no additional sampling was required.

Completeness of QC water samples at greater than 90% was not critical due to the relatively low number of samples that exceeded SOR thresholds and the low magnitudes of the Tier II AL exceedances. Stated differently, false positives are not at issue within results for this project.

As shown in Table 10, all soil samples and analytical methods were validated at the required minimum frequencies (i.e., >10%), including samples analyzed by gamma spectroscopy (36 samples were validated [~36%], with no rejections). Overall, data rejection was minimal (i.e., less than the DQO of 10%), and did not affect overall completeness percentages.

10.2.5 Comparability

All results presented are comparable with nation-wide Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) data and DOE complex-wide environmental data. This comparability is based on

- Use of standardized engineering units in the reporting of measurement results,
- Consistent sensitivities of measurements, generally $\leq 1/2$ corresponding ALs,
- Use of Site-approved procedures (e.g., contractual statements of work for laboratory analyses),
- Systematic quality controls, and
- Thorough documentation of the planning and sampling/analysis process, and data reduction into formats designed for making decisions derived from the project's original DQOs

68

10.2.6 Sensitivity

Adequate sensitivities, in units of ug/kg for organics, mg/kg for metals, and pCi/g for radionuclides were attained for all analytes, with exceptions noted below

CAS NO	ANALYTE NAME
51-28-5	2,4-DINITROPHENOL
121-14-2	2,4-DINITROTOLUENE
606-20-2	2,6-DINITROTOLUENE
91-94-1	3,3'-DICHLOROBENZIDINE
111-44-4	BIS(2-CHLOROETHYL) ETHER
10061-01-5	CIS-1,3-DICHLOROPROPENE
621-64-7	N-NITROSO-DI-N-PROPYLAMINE
98-95-3	NITROBENZENE
87-86-5	PENTACHLOROPHENOL
10061-02-6	TRANS-1,3-DICHLOROPROPENE

The following four analytes also had detection limits greater than RFCA Tier I ALs

CAS NO	ANALYTE NAME
121-14-2	2,4-DINITROTOLUENE
606-20-2	2,6-DINITROTOLUENE
111-44-4	BIS(2-CHLOROETHYL) ETHER
621-64-7	N-NITROSO-DI-N-PROPYLAMINE

Adequate sensitivity is typically indicated by comparing an MDL (i.e., minimum detectable activity [MDA] for radionuclides) with the analytes respective AL. Ideally, detection limits are less than one half of the analytes associated AL.

10.3 Data Quality Summary

Data quality is acceptable for the project, with the qualifications stated in this section, based on a comparison of results with the referenced V&V criteria

Purpose of Contact. To record method of removal and disposition of the 828 Pit in the 886 Cluster D&D Project

Discussion

Over the last several weeks there has been several discussions regarding removal and disposition of the 828 Pit. At the meeting on April 23, 2002, after discussion regarding elevated count of the water that had seeped into the pit it was decided that the entire pit would be removed and not just the top three (3) feet. Since the entire pit would be removed and free released (if possible) it was agreed that it would no longer be necessary to perform a PDS or to include the 828 Pit in the final PDSR for the project.

It was determined that, in addition to radiological samples inside the pit, Radiological Technicians would do a 100% survey on the underside of the bottom of the pit and the earthen side of the bottom 6' of the walls, and a 30% survey on the earthen side of the remainder of the walls. If no contamination was found then a PRE would be written and the concrete would be sent to the site rubble pile. It was further determined that Environmental Restoration (ER) would review the location of the HEUN and Process Waste lines that went in the pit for signs of leakage and take samples of the soil under the pipes. ER would also sample the soil under the pit prior to backfill. If elevated levels of contamination was not found then the area could be backfilled with clean dirt. Elevated levels of contamination would have required proper disposition of the contaminated dirt.

On May 16 in a telephone conversation with J R Marschall, Dave Kruchek also gave permission to remove the pit in as large of pieces as possible, put it on the surface and allow it to dry before performing the radiological surveys. Also on May 16 the pit was removed as above and ER took under-slab samples of the dirt as discussed, however, the concrete was so poor that it came out in the consistency of "oatmeal". This made the 100% survey for radiological contamination on the underside of the bottom of the pit impractical and it was decided by the Project Team to take environmental samples of the floor to determine radioactivity. The large pieces of the pit walls were allowed to dry out and Radiological Operations scanned 100% of the surfaces and took (30) point samples. The pit area was not to be backfilled until all samples results were known. The radiological scans and point samples of the walls and the environmental samples taken of the earth under the HUEN lines, process waste lines, and under the pit floor were all below Tier II levels. Late in the day of May 21, the project was given approval by Environmental Restoration to backfill the pit area which was accomplished on May 22 using clean dirt. None of the concrete was found to be contaminated and the majority of the rubble from the pit was put in the on-site rubble pile with a small percentage of the pit (mostly rebar) sent to the Erie landfill.

IHSS Group 800-4
(800 164 2 and UBC 886)

KEY

- Foundation Drain (Approximate)
- Adjacent and Nearby IHSSs
- FY 2002 IHSS location
- FY 2002 PAC location
- FY 2002 UBC location
- Building/structure
- Paved area
- Dirt road
- Stream ditch or other drainage feature
- OPWL location (estimated)

State Plane Coordinate Projection
Colorado Central Zone
Datum NAD 27
